Free online client galleries for photographers

Turn a finished shoot into a clear client handover.

An online client gallery gives customers a dedicated place to view a curated collection. GalleryDock supports photographers and filmmakers who want to present work, collect selections and deliver files through a structured gallery experience. A useful first project is small enough to test from upload to client access.

Build your first delivery workflow

01. Choose one completed assignment and upload client-ready media. Keep original files and independent backups separately.

02. Arrange the collection in an intentional order. Explain whether the customer should view, select or download the work.

03. Open the gallery as a client, test the enabled actions and send a short delivery message with clear next steps.

Questions & answers

What is a good free client gallery for photographers?

GalleryDock is an option to evaluate when you need online presentation and client collaboration. Compare storage, access controls, selection tools and the actual customer experience before deciding which service fits your work.

How many galleries can I create for free?

GalleryDock currently includes three galleries and 1 GB of storage in its Free plan. Additional capacity and features depend on the plan; review current pricing when signing up.

Embed a photo gallery on your own website

Give clients a familiar destination alongside your portfolio.

A website embed connects a GalleryDock gallery with an existing business website. GalleryDock hosts the collection, while the website supplies the surrounding page and navigation. This can bring the viewing experience closer to the same portfolio and service information clients used before booking.

Prepare the page before sharing it

01. Choose a page with a clear purpose, such as client delivery or a portfolio preview. Avoid distracting elements beside the gallery.

02. Use the generated GalleryDock embed code in a compatible HTML or embed block. Your website platform and plan must allow the code.

03. Test the published page on a phone and a desktop. Confirm the right collection, usable controls and clear access instructions.

Questions & answers

Can I add a client gallery without rebuilding my website?

Yes, if your current editor supports the required embed code. Add it to an appropriate page and check the published result. Some website plans restrict custom HTML or embedded content.

Can different clients use one gallery access page?

GalleryDock also offers a central access point: clients enter their gallery password to open the corresponding collection. This is distinct from embedding one specific gallery and avoids a separate website page for every customer.

Password-protected client photo galleries

Keep access decisions clear for each assignment.

Password protection adds an access step before someone opens a client collection. It is especially useful when the intended audience is limited. In GalleryDock, photographers should review gallery access alongside the separate choices for selections, comments, downloads and other client actions.

Make access understandable

01. Decide who should receive the gallery and which actions they need. A review gallery may require different settings from a final delivery.

02. Send the correct access information only to intended recipients. Explain which collection they are opening and what they should do next.

03. Test the client view without relying on your owner login. Recheck settings when the audience or project stage changes.

Questions & answers

How can I share a private photo gallery with a client?

Prepare the collection, enable the appropriate access settings and provide the client with the gallery route and password. Test that route before sending it, including the actions available after entry.

Does a gallery password prove who is viewing the photos?

No. Anyone who receives a valid shared password may be able to access the collection. Password access is not identity verification, and download permissions should be considered separately.

Online photo proofing and client selections

Move image choices out of scattered messages.

Photo proofing gives a client a defined set of photographs to review before the next production step. GalleryDock includes image selection tools that let customers identify their preferred photographs within a gallery. A clear brief makes those selections more useful to the photographer.

Set up a focused review round

01. Use consistent image names and a considered sequence. Tell the client whether the collection contains proofs or finished photographs.

02. State the requested number of selections, the purpose of the review and the response deadline in your project instructions.

03. Review the returned choices before editing or delivery. Resolve conflicting requests and confirm the agreed scope with the customer.

Questions & answers

How can clients choose their favorite photos online?

Use a gallery with client selection tools and explain how the choices will be used. GalleryDock supports favorites and photo selections so the client can identify images in the context of the collection.

Is selecting a photo the same as approving it for delivery?

Not automatically. A favorite may mean “please edit this” or “I am considering this.” Define what a selection means for your project and confirm final approval through your agreed process.

Client video feedback for filmmakers

Give every review round a clear purpose.

Video feedback works best when the filmmaker and client agree on what is being reviewed. GalleryDock provides video feedback tools alongside its photo gallery workflow. A focused review can keep creative decisions connected to the work rather than dispersed across unrelated conversations.

Organize the next revision

01. Share the intended review version and identify the decisions the client should make, such as pacing, content or a specific requested change.

02. Ask for precise comments. Where helpful, have reviewers identify the relevant moment and explain the outcome they want.

03. Consolidate feedback, clarify contradictions and confirm the scope of the next revision. Keep a clear distinction between review and final delivery.

Questions & answers

How can I collect useful client feedback on a video?

Provide the review version, a short brief and a deadline. GalleryDock offers video feedback tools; ask clients to describe the exact change needed rather than leaving broad comments such as “make it better.”

Can one workflow cover photography and filmmaking?

GalleryDock supports photos and videos. You can evaluate it for mixed creative projects, while keeping each review task clear and checking the storage, file-size and feature limits of your chosen plan.
